

The figure displays three stacked Manhattan plots showing the association of 22 chromosomes with RNA, Protein, and Buffer. The y-axis represents $-\log_{10}(p\text{-value})$, ranging from 0 to 10. The x-axis is labeled 'Chromosome' and ranges from 1 to 22. The plots are stacked vertically, with RNA at the top, Protein in the middle, and Buffer at the bottom. The Buffer plot shows a grid of horizontal and vertical lines, indicating no significant associations. The RNA and Protein plots show significant associations, with the highest peaks reaching a $-\log_{10}(p\text{-value})$ of approximately 10. The RNA plot shows a significant peak on chromosome 11, while the Protein plot shows a significant peak on chromosome 10. The Buffer plot shows no significant associations.
